

WARPSimLab

Release Notes

Version 4.4

Release Date: September 17, 2026

Overview

Version 4.4 includes a redesigned Scenario Explorer, improved state-file directory management, terminology updates, additional diagnostics, and numerous internal improvements.

Changes and Improvements

- Corrected core tolerances that were too strict.
- Added diagnostic reporting to a local log for errors encountered in the simulation core.
- Redesigned and enhanced the Scenario Explorer GUI.
- Refactored the Scenario Explorer to provide clearer ownership and separation of responsibilities between components.
- Performed significant cleanup of legacy variable names.
- Improved state-file directory management. WARPSimLab now remembers and lists the five most recently used state-file directories.
- Added metadata headers to JSON state files, including the state-file schema version and the WARPSimLab version that created the file.
- Added Lifetime Funding Gap information where appropriate.
- Added a warning when Portfolio Percentages have been changed but Apply Percentages has not been selected.
- Changed user-facing terminology from Before Tax and After Tax to Tax Deferred and Taxable.
- Added smarter starting-year selection logic.
- Fixed numerous minor bugs.

Known Limitations

- Results are generated from simplified mathematical models. For example, the current model assumes that 100% of Social Security benefits are taxable. After-tax equity realized gains and dividends are combined and treated as qualified long-term capital gains.

- Simulations simplify financial markets and individual financial situations and do not reproduce every real-world condition.
 - Output should not be interpreted as predictions or recommendations.
-

Future Development

- Add explicit future health-expense options.
- Add additional retirement withdrawal options.
- Add additional pension growth and adjustment options.
- Add scalable GUI fonts to improve application scaling across different display sizes and resolutions.
- Expand documentation.
